Category FOCL - fiber optic communication lines FOCL Section contains information about FOL Fiber optics and communications Types of optical fibers Optical telecommunications Optical network The project FOL Requirements of VOLS-VL FOCL-conductor equipment systems Equipment and apparatus, fiber-optic communication lines Equipment and networks, fiber-optic communication lines Conditions for installation of fiber communication lines Why fiber optic The pros and cons of optical networks Optical technology transmission reception channel Fiber-optic network Principles of optical fiber The advantages of fiber optics Laying of fiber-optic network Fiber optics is the future of information transmission Rules of placement of fiber-optic cables on power Characteristics of optical cables Fiber optics theory and concepts Theory of optical fibres part 2 Laying of cable the FOL Volpe technology General provisions of the construction management of VOLS-VL The mechanical connection of fiber optic Where used FOL RRT pipe for laying of fiber optic Technological processes for the laying of fiber optic Fiber optic - equipment for certification and testing The measure of the length of fiber optic and OTDR Rules of laying of fiber optic Types of optical fibers for fiber optic The creation of the VOLS of OXN The choice of technology of construction of fibre optic power lines OK the basis of fiber optic technology Fiber optic and network equipment and measurement of fiber optic Construction of FOCL in the village Device in the sewer mines VOLS Laying fiber optic cable, fiber optic The reliability of VOLS-VL Selection of technology FOCL-conductor STAGES The choice of technology of fiber-optic communication lines What is FOCL Basic concepts and scope of FOL Fiber-optic communication lines FOCL Construction technology fiber-optic and high-voltage communication lines FOCL-conductor, OPGW TECHNOLOGY - OPTIC GROSOTTO After the construction of the fiber optic system it is necessary a check which should establish that the facility meets all the standards of the project and meets requirements of functionality. Qualitatively performed the scan may prevent an emergency situation. Typically, production control is carried out by the organization as the main contractor and this operation is carried out during the execution of construction works. The organisation of such verification consists of three items The objective of input control is to verify and thoroughly review all documents on the basis of which will be development of the project and further work on the construction and installation of project-estimate documentation is still going through the staffing of documents and the quality of their filling. As to the duties of an input control of the receipt of all materials required for the work. The responsibility for this assumed by the main
